                               The present sequence is human alpha2B-adrenoceptor (alpha2B-AR) protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids polypeptide. Alpha2B-AR gene is located on chromosome 2. Alpha2B-AR polypeptide. Alpha2B-AR gene is located on chromosome 2. Alpha2-AR norepinephrine and epinephrine. An antagonist of alpha2B-adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (CHD), unstable chronic angina pectoris which is clinically expressed as coronary heat disease prinzmetal's variant form or acute myocardial infarction (AMI).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Snapir A,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                               The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the matchine.
                                                                                                                                                                                                                                                                      Detecting a risk of hypertension and targeting by determining the pattern of alleles encoding alpha-2-adrenoceptor -

The present invention describes antigenic peptides (1) comprising:
CC (a) any one of 1601 sequences (see ABP82019 to ABB93619) of 12-24 amino
CC acids. Also described: (1) an assay for the detection of a particular
CC and (2) an isolated antibody having high specificity and high affinity
CC or avidity for a particular GPCR. (1) can be used as GPCR modulators and
CC an antibodies. The antigenic peptides for GPCRs are useful in detecting
CC antibodies. The peptides and antibodies are also useful for detecting the
CC gresence or absence of corresponding GPCRs. The antigenic peptides for
CC gresence or absence of corresponding GPCRs. The antigenic peptides for
CC gresence or absence of corresponding GPCRs. The antigenic peptides for
CC diseases, or autoimmune diseases, growth-related designing drugs for
CC diseases, or autoimmune diseases, growth-related cell proliferative
CC atherosciterosis, bacterial, fungal, protozoan or viral infections,
CC diseases, parkinson's disease, multiple sclerosis, paraft versus host
CC diseases, parkinson's disease, multiple sclerosis, pain, psoriasis,
CC consist, depression, schizophrenia, dementia, mental retardation, memory
CC any other disorder in which GPCRs are involved. The antibodies may be
CC GPCR proteins given in ABP81675 to ABP82018, which are used in the
CC exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic (2 receptor gene (1)-(III) by detecting a polymorphic site, comprising; (2 (a) obtaining a sample having a polymucleotide encoding an alpha-2B, CC alpha2A or alpha2C or fragment or complement of; and CC of (1), a site comprising cytosine or guanine at position 753 of (IIV) CC or a site comprising (A) (939939309) or (B) (93939353) at (IIV) CC alpha2B, alpha2A or alpha2C receptor gene and further used to determine CC alsociated with alpha2B, alpha2A or alpha2 for gene and further used to determine CC disease, central nervous system disease and comprising detecting a CC disease, central nervous system disease and comprising detecting a CC disease, central nervous system disease and combinations of these. In CC disease, contral nervous system disease and combinations of these or an alpha2B, alpha2A, or alpha2C agonist (e.g. epinephrine, CC combinations of these) or antagonist (e.g. epinephrine, CC combinations of these) or antagonist (e.g. yohimbine, prazosin, ARC 239, CC combinations of these or antagonist (e.g. yohimbine, prazosin, ARC 239, CC cyclase, MAP kinase activity, phosphorylation or inscitol phosphate to a cyclase, MAP kinase activity, phosphorylation or inscitol phosphate CC the human alpha-2BAR variant protein, the sequence is that of the third intracellular loop of the human alpha-2BAR variant protein, the sequence is detected for the 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 5

Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor polypeptide. The variant is obtained by deletion of three glutamates from the Glu repeat (amino acids 307-309). Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (CHD), unstable chronic angina pectoris which is clinically expressed as Prinzmetal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for detecting a risk of hypertension by determining the pattern of allels encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human alpha-2B-adrenoceptor variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 26-27; 35pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Clone NGC-alpha2beta was isolated from a human spleen genomic library by screening with a fragment of the human 5-HTIA receptor gene. The gene was used to express recombinant receptor protein which can be used to produce antibodies for inhibition of receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human alpha-2B adrenergic receptor (AAW11804) is a member of the rhodopsin-like signal transducer family. Its amino acid sequence was deduced from a genomic DNA clone (AAT59499) obtd. from a human spleen DNA library. Vectors have been adapted to allow prodn. of alpha-2B adrenoceptor in bacterial, yeast or mammalian cells; transfected Ltk- cells, designated L-NGC-alpha-2B, are deposited as ATCC CRL 10275. Membranes of transfected amammalian cells can used in novel methods to identify drugs which specifically interact with, and bind to, the alpha-2B adrenergic receptor. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR such as binding a GPR ligand or modulating GPR ligand binding to a GPR see AAR48759-R48758, AAR50569-R50807 and AAR89189-R89195 for examples of polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    G-protein coupled receptor; ligand binding assay; transmembrane domain; schizophrenia; dopamine; cAMP; adenosine; thrombin; adrenergic; opsin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              G-protein coupled human alpha-2 C2 adrenergic receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see AAW02747-W02999 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder
                                                                    Modified G-protein coupled receptor useful for identifying inverse agonist or antagonist of the receptor, comprises a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC putative site of palmitoylation and clusters of phosphorylation, and a correlating portion of a carboxyl terminal region of a GPCR, portion fused to CC a portion of the carboxyl terminal from a second GPCR, that comprises CC phosphorylation clusters and a putative palmitoylation site 10-25 amino CC acid residues downstream of a second MPXXY motif. The modified GPCR is CC useful for screening compounds for GPCR activity which comprises CC providing a cell that expresses at least one modified GPCR, where the CC exposing the cell to the compound, detectable molecule, CC exposing the cell comparing the location of the arrestin within the cell in the absence of the compound to the location of the arrestin within CC in the presence of the compound to the location of the arrestin within the cell in the absence of the compound and correlating a difference CC between the location of arrestin within the cell in the presence of the compound. Preferably, the arrestin within the cell in the absence of the compound. Preferably, the arrestin is detected in the absence of the compound. Preferably, the arrestin strip GPCR are CC useful for preventing and/or treating a disease associated with GPCR in CC mammals, such as angina pectoris, alterosclerosis, asthma, emphysema, CC mammals, such as angina pectoris, alterosclerosis, asthma, emphysema, CC mammals, such as angina pectoris, alterosclerosis, asthma, emphysema, CC frametic used in the access ABU6720-ABU67240 represent GPCR polypeptide for arrestin and in the access five the proposed of the compound of the arrestin complysema.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

The method comprises: (1) providing at least one cell expressing GPCR and conjugated proteins; (2) treating the cell with a test compound; (3) obtaining a digital image of the cell by detecting and measuring energy emitted from the detectable molecules; and (4) detecting the localization of some of the conjugated proteins at one of endocytic vesicles and endosomes. The method can be used for detecting compounds that activate GPCR-activity in vivo and in vitro, where the including photo-transduction, olfaction, neurotransmission, vascular tone, cardiac output, digestion, pain and fluid electrolyte balance. The present sequence represents a GPCR amino acid sequence which is given in the exemplification of the present invention.
Genotyping an alpha-2B, 2A, or 2C adrenergic receptor gene useful for determining whether an individual is at increased risk of developing disease associated with the corresponding receptor comprises detecting a polymorphic site -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC of (1), a site comprising (x) (ggggggggcg) or (B) (ggggggggcgg) at CC positions 961-972 of (III). The method may be used for genotyping an CC alpha2B, alpha2A or alpha2C receptor gene and further used to determine CC whether an individual is at increased risk of developing a disease CC associated with alpha2B, alpha2A or alpha2, comprising detecting a CC polymorphic site which correlate to disease selected from cardiovascular CC disease, central nervous system disease and combinations of these. In CC addition, the technique may be used to predict an individual's response CC norepinephrine, clonidine, oxymetazoline, guanabenz, UK14304, BHT933 and CC combinations of these) or antagonist (e.g. epinephrine, clonidine, oxymetazoline, guanabenz, UK14304, BHT933 and CC combinations of these) or antagonist (e.g. vohimbine, prazosin, ARC 239, CC rauwolscine, idazoxan, tolazoline, phentolamine and combinations of these) by detecting the polymorphic site and correlating the site to a CC predetermined response (where the response is correlated to adenylyl CC cyclase, MAP kinase activity, phosphorylation or inositol phosphate CC levels). The present sequence is that of the human alpha-2CAR variant CC protein, deleted for a 4 amino acid polymorphic site at residues 321-324 CK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

Adrenaline receptor gene encoding alpha 2CII receptor for screening drugs reactive to the alpha 2CII receptor XX Claim 1; Page 9-11; 13pp; Japanese.

XX AAQ64890 encodes the amino acid sequence of a polypeptide CC (AAR54834) that constitutes human derived adrenaline alpha 2CII CC receptor. The DNA can be used for the study of the pharmacological CC importance of the gene expression in humans.

XX SQ Sequence 458 AA;
